3 Estimator

Case-case odds ratio

$$\mathrm{OR} = \frac{(\text{venous}/\text{arterial})_{\text{women}}}{(\text{venous}/\text{arterial})_{\text{men}}}$$

Within each of seven age strata;
Mantel-Haenszel age-adjusted summary

Reading the OR

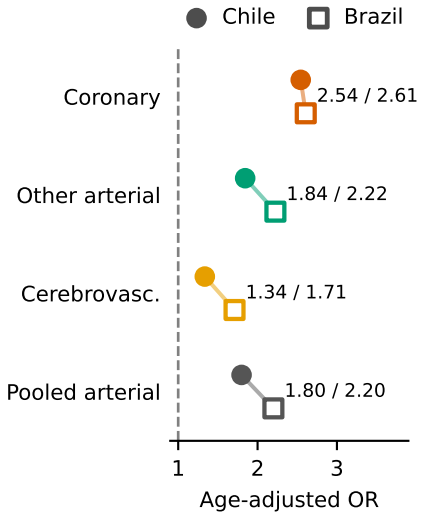
OR = venous rate ratio
÷ arterial rate ratio

Chile, ages 20-29, venous vs coronary:

1.53 ÷ 0.23 ≈ 6.69

Moderately higher venous rate and much lower coronary rate; not a sixfold venous excess. Unrounded rates used.

4 Shared pattern



Larger venous share in women in every age group, in both countries

Largest vs coronary,
smallest vs cerebrovascular

Units are discharge events, not individuals. Odds ratios describe diagnostic composition among selected vascular discharges, not population risk.
